

ANDREAS GAME

Prototype Dungeon v0.2

Visual Game Design Brief for First Playable Prototype

PROTOTYPE FLOW: teach five collaboration relationships, then stress-test all five

THE ONE-LINE LOGIC

The dungeon teaches five collaboration relationships. The boss then repeats, combines, rotates and overlaps those same relationships until all five players operate like one machine.

Visual references are direction only - not a requirement to copy any existing game.

1. Prototype Objective & Visual Language

The first prototype exists to prove one thing: can five players receive unfamiliar roles, rapidly understand their tools, discover player-to-player synergies, and execute increasingly difficult teamwork under pressure?

CORE PROMISE

5 friends. 5 temporary roles. 5 star scenes. 1 boss that requires all five relationships. Nobody can carry alone.

How to Visualize the Game

Element	Visual reference / intention
Preparation arena	League of Legends Arena-style card readability: large timer, clear ability cards, visible synergy links. The preparation window itself is gameplay.
Camera / movement	For the vision, lean toward an It Takes Two-style third-person action camera so movement, hiding behind shields, dashes, bridges and environmental teamwork feel physical.
Role readability	MOBA / MMO clarity without MMO complexity: approximately 3-4 readable active abilities, not a 15-button rotation.
Dungeon fantasy	WoW-style party roles and boss readability, but the actual challenge behaves more like a cooperative action puzzle.
Boss	A raid-boss final exam built from mechanics already learned in the dungeon, then made harder through timing, rotation and overlap.

Core Design Rules

- Random roles prevent permanent specialization and force quick understanding.
- Every player gets one Star Scene where the team genuinely cannot progress without them.
- Every Star Scene teaches at least one Synergy Activation between players.
- The strongest actions often belong to the interaction between players, not to one character.
- The boss uses the same vocabulary; difficulty comes from repeat + combine + rotate + overlap.
- Boss HP is partly a teamwork progress meter - meaningful chunks should be earned through coordinated executions.

2. The 60-Second Preparation Arena

All five players spawn in a small locked circular arena. Roles are assigned randomly and a visible 60-second countdown begins immediately. There is no relaxed loading period: the team is already under pressure to understand the run.

What Each Player Sees

- 3-4 clickable ability cards with icon, name and one-sentence explanation.
- A clear role label: Tank / Support / Runner / Control / Damage.
- A Team Synergies panel showing which abilities have a relationship with another role.
- The interface reveals that a relationship exists, but does not explain the full solution.
- The countdown is always visible so silence literally wastes competitive preparation time.

WHY THIS MATTERS

The first teamwork test is communication itself. A good team starts saying: "My Speed connects to Runner." "My Dizzy only works on Broken." "Okay, you break first, I follow." By the time the teleport happens, the group has already begun forming a temporary playbook.

Core Synergy Types

Enhancement: A teammate transforms or upgrades your ability. Example: Support Speed + Runner Dash -> Thousand Dashes.

Activation: A teammate creates a state that unlocks your stronger action. Example: Armor Break -> Broken -> Mind Fracture.

Sequence: Several players execute in the correct order. Example: Shield -> reposition -> carry -> link -> burst.

3. Five Star Scenes - Part I

Each pre-boss scene has one Star Player. The other four still contribute, but the team cannot progress unless the Star understands and executes their responsibility. Each scene also teaches a synergy that will return many times on the boss.

Scene 1 - The Gravity Bridge

STAR: RUNNER | Fantasy: “I can get us somewhere nobody else can.”

SYNERGY UNLOCK

Support Movement Speed + Runner Dash -> THOUSAND DASHES

The dungeon opens on a large bridge covered by an extreme gravity field. Anyone entering moves at roughly 10% normal speed. A lever on the far side disables the field.

Support casts Movement Speed on Runner. Runner's normal Dash transforms into Thousand Dashes for a few seconds, allowing the Runner to cross and pull the lever.

The lever solves one problem and creates another: the gravity had been holding monsters beneath the bridge. They rise and prioritize the Runner. Tank taunts, Control creates or manipulates safe space, Support keeps the team alive and Damage helps clear while the bridge begins collapsing.

The actual objective is not to kill everything. It is to get the entire party across before the bridge is lost.

What the scene teaches: A teammate can transform Runner mobility; the dungeon may ask the team to use that transformation again later while other mechanics are active.

Scene 2 - Hold the Gate

STAR: TANK | Fantasy: “For the next 15 seconds, everyone trusts me.”

SYNERGY UNLOCK

Control Stabilize + Tank Shield -> FORTRESS

The party reaches a sealed gate that only opens while four pressure plates remain occupied. Four players are effectively locked in position while monster chambers open around them.

Tank is the only fully mobile player. The job is not “do the most damage”; it is to control threat, block projectiles, knock enemies away and keep all four plate-holders alive.

Near the end, normal Shield is not enough. Control applies Stabilize while Shield is active, transforming it into Fortress: a larger, stronger defensive state that can protect multiple teammates and resist knockback.

What the scene teaches: Tank is not simply a high-HP role; protection itself can become a synchronized team action.

4. Five Star Scenes - Part II

Scene 3 - The False King

STAR: CONTROL | Fantasy: “I see what the others cannot. Listen to me.”

SYNERGY UNLOCK

Tank Armor Break -> BROKEN -> Control Mind Fracture

One enemy multiplies into several identical copies. Only one is real. Brute-force attacks on the wrong copy cause penalties such as extra enemies, damage or lost time.

Tank tests a target with Armor Break. When the correct state appears, Control has only a short window to cast Mind Fracture. This reveals information - for example the real target, hidden chains between copies or a momentary visual difference.

Control must then communicate the answer and direct the team. The value is not the spell alone; it is interpretation + callout + timing.

What the scene teaches: One player can create a state that unlocks another player's information/control layer. On the boss, Mind Fracture can be required repeatedly across rotating targets.

Scene 4 - The Dying Room

STAR: SUPPORT | Fantasy: “I decide who gets what, and when.”

SYNERGY UNLOCK

Support Link + Control Channel -> TEAM SPIRIT / LIFE NETWORK

The entire room drains life while several objectives must be completed. Support cannot solve the room by spamming Heal; their limited resources must be allocated between Heal, Shield, Speed and offensive buffs.

Support can create a Link with one teammate. Control can Channel into the active Link to transform it into Team Spirit / Life Network - a temporary group-wide state where healing, damage sharing or shielding moves through the chain.

The training scene makes the correct link relatively obvious. The boss later makes the targets rotate, distance matter and the chain break if players position incorrectly.

What the scene teaches: Support is a decision-maker and network manager, not a passive healer. The team learns a relationship that can become much harder through rotation.

Scene 5 - The Heart

STAR: DAMAGE | Fantasy: “The team created the shot. I have to land it.”

SYNERGY UNLOCK

Team-created Vulnerability + Support Buff -> EXECUTION / OVERLOAD

The final pre-boss chamber contains a Heart or living mechanism that cannot take meaningful normal damage. The other four players manufacture a short vulnerability window using their learned relationships.

Once the target is exposed, Damage has only a few seconds to identify whether the vulnerability is Physical or Magic and use the correct temporary finisher. A strong execution removes a meaningful threshold - for example 5% - and opens the boss chamber.

Damage therefore becomes the closer rather than the permanent carry.

What the scene teaches: The party creates burst windows collaboratively; Damage must read the state and execute at the exact moment.

5. Boss Chamber - The Final Teamwork Exam

BOSS DESIGN RULE

The five Star Scenes teach only the first 5% of each relationship. The boss makes the same relationships repeat, rotate, combine and overlap again and again.

Difficulty Curve

Layer	What changes
LEARN	Each relationship is taught cleanly during a Star Scene.
REPEAT	The boss first asks for a recognizable version so the team recalls the mechanic.
COMBINE	Two learned mechanics happen at the same time.
ROTATE	Targets, links, positions or responsibilities change during execution.
OVERLAP	Several mechanics are active simultaneously with little breathing room.

Example Boss Escalation

- 100-90%: obvious versions of Thousand Dashes, Fortress, Mind Fracture, Team Spirit and Execution.
- 90-75%: two mechanics combine - e.g. Runner crosses under gravity while Tank protects the stationary group.
- 75-50%: rotations begin - e.g. Team Spirit changes marked player every few seconds and the chain must reorganize.

- 50-25%: mechanics overlap - e.g. clones + life drain + gravity within the same sequence.
- 25-5%: minimal breathing room; communication becomes continuous.
- Final 5%: a compressed orchestration where every player must execute their relationship in sequence and failure by one breaks the whole chain.

Boss HP Is Not Just Damage

Large chunks of HP should correspond to successful teamwork executions. The team is not simply doing rotations until a health bar reaches zero; it is repeatedly earning vulnerability windows and converting them into progress.

THE DESIRED DISCORD MOMENT

“RUNNER GO!” -> “FORTRESS NOW!” -> “REAL ONE BACK LEFT!” -> “LINK IS ROTATING!” -> “EXECUTION - DO IT!”

6. What We Actually Need to Build First

This brief describes the design logic. Prototype v0.1 should still be deliberately ugly and narrow. The goal is to prove the feeling, not production quality.

- 5 players connected in one simple multiplayer session.
- One 60-second preparation arena with random roles, ability cards and visible synergy links.
- One compact dungeon containing the five Star Scenes.
- One boss that reuses those five relationships and escalates through repeat + combine + rotate + overlap.
- Approximately 3-4 active abilities per role.
- No account progression, cosmetics, global tournament, prizes or polished art required.
- Use placeholder geometry, effects and UI wherever possible.

Prototype Success Test

WE HAVE SOMETHING IF...

Five friends are speaking almost constantly, each player has at least one moment where the group depends on them, synergy activations feel satisfying, the boss creates controlled chaos, and after a wipe the group immediately wants another attempt.

Questions for Theodor / Technical Lead

- What is the fastest engine / stack for us to test this interaction loop with 5 real players?
- For the first prototype, should we build the intended third-person camera or use a simpler camera temporarily to validate mechanics?
- Which mechanics are technically cheap enough to fake first (gravity, links, role transformations, status conditions, boss states)?
- What should be authoritative on the host/server so the five-player synchronization feels reliable?
- What is the smallest build that lets us play the full 60-sec prep -> five scenes -> boss loop with friends?

FIRST MILESTONE - 5 FRIENDS | 5 STAR MOMENTS | 5 SYNERGIES | 1 BOSS | EVERYONE MATTERS
